

## Research Interests

**Fields:** Economics of Education, Behavioral Economics

**Methods:** Experimental Economics, Applied Microeconometrics

## Current Position and Affiliations

**Postdoctoral Researcher in Behavioral Economics**, Düsseldorf Institute for Competition Economics (DICE), Heinrich Heine University Düsseldorf Düsseldorf, Germany since Jun 2026

**Affiliate**, Behavioral Insights and Parenting Lab (BIP Lab), University of Chicago Chicago, USA

**Affiliate**, FAIR – The Choice Lab, NHH Norwegian School of Economics Bergen, Norway

## Education

**PhD in Economics**, NHH Norwegian School of Economics, affiliated with FAIR Bergen, Norway Sep 2026

- **Dissertation:** Essays on Belief Formation in the Family
- **Supervisors:** Alexander W. Cappelen (primary) and Kjell G. Salvanes (secondary)
- **PhD Committee:** Mathias Philip Ekström, Ulf Zölitz, and Silke Anger

**Research Stay**, Harris School of Public Policy, University of Chicago Chicago, USA  
Hosted by Ariel Kalil Sep 2023–Apr 2024

**MSc in Economics**, University of Mannheim Mannheim, Germany  
2017–2019

**BSc in Economics**, University of Mannheim Mannheim, Germany  
2013–2016

**Economic Mobility and Parents' Opportunity Hoarding**, with Mesmin Destin, Ivan A. Hernandez, Ariel Kalil, Rebecca M. Ryan, and David Silverman. *Proceedings of the National Academy of Sciences of the United States of America (PNAS)*, 121 (37), e2407230121. [Published Version](#) 

## Working Papers

**Biased Parental Beliefs: Experimental Evidence from Norway.** [Draft](#) 

Parents' beliefs about their children's abilities shape parental behavior and decision-making. But do parents process information about their children's abilities objectively or in a biased way? I study this question in a large-scale lab-in-the-field experiment with Norwegian elementary school students and their parents ( $N = 743$  parent-child pairs) to examine how parents update beliefs when receiving noisy signals about their child's performance in a cognitive (mathematics) or a non-cognitive (prosociality) skill. In *mathematics*, updating is symmetric, with parents being similarly responsive to both positive and negative signals. In *prosociality*, by contrast, parents update their beliefs more strongly to good signals but are significantly less responsive to negative signals. The asymmetry is particularly pronounced when signals are framed as reflecting parents' own traits. Following negative prosocial signals, parents engage in ex-post rationalization: they rate their child's effort and the relevance of the signals as lower. Survey evidence indicates that these domain differences stem from two factors: parents are better informed about their child's performance in mathematics, and they view prosociality as more central to their child's broader life success. Biased belief updating thus emerges when information is sparse and outcomes are ego-relevant, with important implications for how feedback is designed and delivered in educational contexts.

## Parental Messages and Children's Confidence, with Kai Barron, Michela Carlana, and Oda Sund.

This paper studies how parents may curate the ego-relevant information children receive about themselves and how this information influences the beliefs and behavior of children. Using a lab-in-the-field experiment with Norwegian seventh-grade students and their parents, we show that parents send messages to their children that are systematically more favorable than parents' private beliefs. Children incorporate these messages into their self-assessments: receiving a parental message raises their posterior beliefs about their relative performance. This increase in confidence does not, however, affect immediate quiz performance or the domain in which children choose to compete. Parents send slightly more favorable messages when children receive them before rather than after the quiz and are more likely to explain these messages in terms of motivating the child, consistent with anticipated motivational benefits shaping what parents communicate. These findings show that beliefs about ourselves depend not only on how individuals process information, but also on how others curate the information they receive.
